Exhibit A. Origin and Breeding History of the Variety

Soybean Variety 93B34

Variety 93B34 evolved from a 1993 cross of 9281/4/9281/3/9273//9273/40-3-2.

It is an F4-derived variety which was advanced to the F4 generation by modified single seed descent. The F5 progeny row of 93B34 was grown in Chile during the winter of 1994-95. Subsequently, 93B34 has undergone 3 years of extensive testing and purification and has been observed by the breeder to be uniform and stable for all plant traits from generation to generation, with no evidence of variants. On the basis of high yield, multi-race *Phytophthora* resistance and resistance to labeled Roundup Brand herbicides, variety 93B34 was given a commercial number.

One half acre of 93B34 (breeders seed) was grown in the winter of 1995-6. 15 acres of parent seedstock (foundation seed equivalent) were grown in the summer of 1996, and 690 bushels harvested.

Exhibit B. Statement of Distinctness

Soybean Variety 93B34

Soybean variety 93B34 is most similar to the varieties 9333 and 93B01. These varieties have purple flowers, tawny pubescence, black hila, multi-race *Phytophthora* resistance and resistance to labeled Roundup Brand herbicides. However, 93B34 is significantly shorter than 9333, and significantly taller than 93B01 (Tables 1 and 2 respectively).

Exhibit D. Additional Description of the Variety

Soybean Variety 93B34

In Exhibit C we have identified variety 93B34 as susceptible to bacterial blight, brown spot, pod and stem blight, rhizoctonia root rot, bud blight, yellow mosaic, cowpea mosaic, pod mottle and seed mottle.

This does not mean that variety 93B34 is any worse for these problems than other varieties of similar maturity. Rather, we do not consider 93B34 to be immune to these problems. Therefore, we have chosen to be conservative and have identified the line as "susceptible".
